

OUR NEW RANGE OF ROAD RESTRAINT SYSTEM

DESAMI

Outstanding design

With about fifteen years of experience and close collaboration with the various actors in the road sector, this new range of products was born. We felt that we could develop a system that combined security with successful landscape and architectural integration.

With strong and committed partners, this concept has become a reality.

Less effort, less reinforcement

Thanks to its geometry, its fuse system and the disconnection of the board, DOLRE offers transmitted forces reduced by more than 50% compared to a conventional construction. Thus, a majority of existing structures will no longer need to be reinforced. This requires limited intervention and more effective work management.

Adaptable to your needs

DOLRE can be placed on:

- a concrete or steel support such as on engineered structures
- a wall head
- a buried concrete massif
- a non-anchored sill

It can be equipped with a guardrail or a cladding.

Finally, DOLRE can be connected to various slides thanks to the developed transitions.
